Tathagat Agrawal

tathagat.2909@gmail.com | GitHub | LinkedIn | Website

Applied ML researcher and scientist building end-to-end production AI systems: LLM fine-tuning, RAG, agentic tool-calling, evaluation frameworks, multi-task NER and learning-to-rank. Published 3 peer-reviewed papers.

Technical Skills

Languages and tools: Python, C/C++, Java, JavaScript, R; Git, GitHub, Claude Code, Cursor, LaTeX
Generative AI and LLMs: LLM fine-tuning (SFT, LoRA), Retrieval-Augmented Generation (RAG), embeddings and vector search (ChromaDB, Sentence-Transformers), prompt engineering, agentic AI and tool calling (LangGraph, LangChain, ReAct), LLM evaluation, hallucination mitigation, OpenAI and Gemini APIs, LLaMA-Factory
ML and Deep Learning: PyTorch, TensorFlow, Keras, Scikit-Learn, XGBoost, HuggingFace Transformers, learning-to-rank, NER, SHAP, OpenCV, spaCy, NLTK
Deployment and MLOps: FastAPI, Flask, REST APIs, Pydantic validation, MLflow, Azure ML, model monitoring
Data and Visualisation: Pandas, NumPy, data pipelines and feature engineering, Matplotlib, Seaborn, Power BI, Excel

Work Experience

Applied Scientist (AI/ML) — **October 2025 – Present**
Neural Nurture — *Indore, MP, India*

- Built a **learning-to-rank recommendation system** (LambdaMART/XGBoost) for the travel industry with custom relevance features, **improving NDCG@3 by about 40%** over the prior baseline; added SHAP/attention-weight explainability for end users.
- **Fine-tuned LLMs** using SFT and LoRA to generate natural language explanations for recommendations; diagnosed and resolved a training data bias causing hallucinations, **improving factual accuracy to 98.4%**.
- Built and trained a **multi-task NER + intent classification model** (RoBERTa backbone) on a custom dataset of 100,000 annotated samples covering 44 entity classes, achieving an F1-score of over 94%.
- Designed the **agentic tool-calling architecture** for a conversational travel application, including prompt engineering and external API integration (ToS compliance, cost optimization), to route structured NER output to the right tools.
- Designed an **end-to-end evaluation framework**, leading to early bug discovery and continuous performance monitoring.
- Translated recent **ML research** into production-ready prototypes through controlled experiments across LLMs and conventional ML models; presented experimental results and architectural proposals to senior leadership, influencing product roadmap decisions; conducted technical interviews for ML internship candidates.

Projects

Agentic Eval Framework — **September 2026**
Python, Gemini API, LangGraph, LangChain, SQLite, Pydantic — *GitHub*

- Built an architecture-agnostic framework scoring agentic LLM systems on six deterministic, rule-based metrics (numeric correctness, dual groundedness checks, contextual/clarification/refusal correctness, tool-call efficiency) with no LLM-as-judge.
- Implemented four interchangeable agent architectures (LangGraph state machine, ReAct, context-stuffing, plan-and-execute) behind one adapter interface; the comparison report shows concrete trade-offs (e.g., 50%-vs-100% groundedness).

AI Clinic Scheduler — **August 2026**
LangGraph, LangChain, FastAPI, Pydantic, ChromaDB, Sentence-Transformers, OpenRouter — *GitHub*

- Built an LLM-powered scheduling agent (LangGraph ReAct) that interprets patient symptoms and recommends a doctor via RAG over specialties and bios (Sentence-Transformers embeddings, Chroma vector store, callable retriever tool).
- Defined Pydantic schemas for every tool call so malformed arguments surface as correctable errors; built a FastAPI backend (chat, doctor/slot lookups, admin) and a no-build-step HTML/JS frontend for booking and receptionist admin.

Strategy Backtester — **August 2026**
Python, pandas, NumPy, CCXT, Typer, Rich, pytest, Matplotlib — *GitHub*

- Built an event-driven backtesting engine from scratch with slippage and transaction-cost modeling, limit/stop and bracket (OCO) orders, and lookahead-bias prevention enforced by a dedicated regression suite.
- Built a CCXT market-data collector and analytics suite (Sharpe, Sortino, CAGR, max drawdown, win rate), validated on 9 months of real BTC/USDT hourly data; shipped SMA crossover and RSI mean-reversion strategies.

Other projects:

- **Semantic Segmentation using U-Net** (PyTorch, July 2025): binary segmentation on the Oxford-IIIT Pet dataset with augmentation pipelines; 91.89% segmentation accuracy.
- **Star Classification using Supervised Learning Models** (Scikit-learn, MLflow, Flask, August 2025): MLP, SVC and Random Forest classifiers for six-class stellar classification, with MLflow tracking and a Flask app.
